An Unquiet Mind
by Kay Redfield Jamison

About the Book

For years, Kay Redfield Jamison led a double life. An international authority on manic-depressive illness, and one of the few women who have achieved the status of full professor of medicine at an American university, Jamison was harboring a secret: she herself suffered from manic-depression. A mercurial, emotional child and adolescent, Jamison suffered her first severe attack of the disease at seventeen; a decade later, shortly after she joined the UCLA faculty, her mood swings had developed into full-blown psychosis.

In her memoir, An Unquiet Mind, Jamison tells of her battle with the illness: the joy of the manic highs, which gave her an omnipotent feeling of cosmic connectedness, and the terrifying depressions, when she wanted only to die. Though she responded to lithium, Jamison, like many patients, became addicted to the highs of mania and resisted taking it. It was only after the disease had destroyed her first marriage and very nearly her life that she accepted the "rather bittersweet exchange of a comfortable and settled present existence for a troubled but intensely lived past"[p. 211]. An Unquiet Mind tells of how Kay Redfield Jamison used her zeal and intensity, and her impressive intellectual gifts, to bring the complexities of manic-depressive illness to the world's attention. Her work has helped save countless lives.

Discussion Guide

1. "The long and important years of childhood and early adolescence...were to be an extremely powerful amulet, a potent and positive countervailing force against future unhappiness"[p. 15]. What aspects of Jamison's early life and upbringing helped to provide her with emotional support on which to draw years later?

2. What benefits did the conservative military lifestyle led by the Jamisons confer upon the young Kay Jamison? With what disadvantages did that same culture, with its stiff-upper-lip creed, afflict her in her battle with mental illness?

3. In graduate school, Jamison writes, "Despite the fact that we were being taught how to make clinical diagnoses, I still
did not make any connection in my own mind between the problems I had experienced and what was described as manic-depressive illness in the textbooks"[p. 58]. Why did she refuse to acknowledge the obvious? Why didn't she question the "rigid, irrelevant notions of self-reliance"[p. 101] she had been taught?

4. "Being open is the sort of thing that I advise people to think very long and hard about," Jamison has stated. "It's one thing if you're independently wealthy. It's another thing if you're out in the real world"("Washington Post Magazine, 4/16/95). Why did Jamison avoid bringing her illness into the open for so many years, and what made her finally decide to do so?

5. Jamison worries that we could "risk making the world a blander, more homogenized place if we get rid of the genes for manic-depressive illness"[p. 194]. On the other hand, E. Fuller Torrey, a well-known author and schizophrenia researcher, says he "would quite happily lose a van Gogh to treat the disease"("Washington Post Magazine, 4/16/95). Which point of view do you endorse? Can you sympathize with both sides of the issue?

6. With her book Touched with Fire and her public television specials on artists like Byron, van Gogh and Schumann, Jamison has been accused by some of her colleagues of romanticizing manic-depressive illness by associating it with creative genius. Does this accusation seem reasonable or unreasonable to you?

7. "Lithium moderates the illness," Jamison observes, "but therapy teaches you to live with it"("Time, 9/11/95"). Has she convinced you that drugs plus psychotherapy is the answer for mental illness? In that case, might not psychotherapy benefit people suffering from any debilitating illness, not just a mental one?

8. Some physicians wonder whether the increased use of mood-regulating medications might lead to a society-wide practice of chemically altering personality, with the result of making people blander and more conformist (the widespread use of the anti-depressant Prozac has helped fuel this debate). "Which of my feelings are real?" Jamison asks. "Which of the me's is me"[p. 68]? Jamison's sister discouraged her from taking lithium, saying that her "soul would wither if [she] chose to dampen the intensity and pain of [her] experiences by using medication"[p. 99]. How much of personality do you believe to be intrinsic, and how much is a result of biological impulses and chemicals? Is such a question even answerable?

9. Her work, and her own illness, convinces Jamison of "the total beholdenness of brain to mind and mind to brain. My temperament, moods, and illness clearly, and deeply, affected the relationships I had with others and the fabric of my work. But my moods were themselves powerfully shaped by the same relationships and work"[p. 88]. Jamison expresses anger against physicians who draw a distinction between "medical illnesses"and psychiatric illnesses [p. 102]. Does she imply that there is, in actuality, no difference? If there is a difference, of what does it consist?

10. "Depression, somehow, is much more in line with society's notions of what women are all about....Manic states, on the other hand, seem to be more the provenance of men"[p.122]. What might the results of this stereotyping be when it comes to giving treatment?

11. After David's death, Jamison reflects that "grief, fortunately, is very different from depression"[p.150]. How can you explain the essential difference between the two? Is it more possible to cope with the "real"causes of grief than with the impalpable causes of depression?
12. Through bitter experience Jamison comes to recognize the value of emotional steadiness in a relationship, but "somewhere in my heart," she writes, "I continued to believe that intense and lasting love was possible only in a climate of somewhat tumultuous passions" [p. 170]. Is this feeling peculiar to Jamison and her temperament, or does it reflect certain assumptions in our society? How is the importance of love and friendship demonstrated again and again in the story? How does each of the three principal men in Jamison's life help her to seek a cure?

13. Jamison worries that her work may now be seen by her colleagues "as somehow biased because of my illness," while admitting that "of course, my work has been tremendously colored by my emotions and my experiences" [p. 203]. Does this make her work less viable than strictly "objective" work, or more so?

14. "My major goal has been to really try and make a difference in how the illness is seen and treated" (Philadelphia Inquirer, 9/18/95). Has she succeeded, so far as you are concerned? Which of your preconceptions were changed by reading her account?

15. "Do I really think that someone with mental illness should be allowed to treat patients?" [p. 204] Jamison asks. She ultimately answers the question in the affirmative. What would your own answer be?

**Author Bio**

Kay Redfield Jamison is the daughter of an Air Force officer and was brought up in the Washington, D.C. area and in Los Angeles. She attended UCLA as an undergraduate and as a graduate student in psychology, and she joined the faculty there in 1974. She later founded the UCLA Affective Disorders Clinic, which became a large teaching and research facility.

Dr. Jamison is now Professor of Psychiatry at the Johns Hopkins University School of Medicine. The textbook on manic-depressive illness that she wrote in association with Frederick Goodwin was chosen in 1990 as the Most Outstanding Book in Biomedical Sciences by the Association of American Publishers. She is also the author of a trade book, Touched with Fire: Manic-Depressive Illness and the Artistic Temperament (1993), and has produced three public television specials on the subject: one on manic-depressive composers, one on van Gogh, and one on Lord Byron. The recipient of numerous national and international scientific awards, Dr. Jamison was a member of the first National Advisory Council for Human Genome Research, as well as the clinical director for the Dana Consortium on the Genetic Basis of Manic-Depressive Illness. She lives in Washington, D.C., with her husband, Dr. Richard Wyatt, a physician and scientist at the National Institutes of Health.
